

Week 10 : SOFTWARE DEVELOPMENT TOOLS AND ENVIRONMENTS

Dockerfile and Docker Image

Dockerfile

- Dockerfile is instructions to build Docker Image
 - How to run commands
 - Add files or directories
 - Create environment variables
 - What process to run when launching container
- Result from building Dockerfile is Docker Image

Dockerfile

Sample Dockerfile

```
FROM node:14.15.0-alpine3.12 ← OS + System Packages
COPY . /nodejs/.           ← Source Code
WORKDIR /nodejs
RUN npm install             ← Library Dependencies
ENV VERSION 1.0            ← Configuration
EXPOSE 8081
CMD ["node", "/nodejs/main.js"]
```

Dockerfile reference

FROM <image:tag>	Sets the base image for subsequent instructions.
RUN <command>	Execute any commands in image.
CMD <command> <param1> <param2>	Sets the command to be executed when running the image.
LABEL <key>=<value> ...	Adds metadata to an image.
EXPOSE <port>	Informs Docker that the container listens on the specified network ports at runtime.
ENV <key> <value>	Sets the environment variable.
COPY <src> <dest>	Copies new files from source to the filesystem of the container at the path destinations.
ENTRYPOINT <command> <param1> <param2>	Command line arguments will be appended after all elements in an exec form ENTRYPOINT.
VOLUME ["/data"]	Sets mounted volumes from native host or other containers.
WORKDIR <path>	Sets the working directory for any commands.

How to create my own image?

Dockerfile

```
FROM Ubuntu

RUN apt-get update
RUN apt-get install python

RUN pip install flask
RUN pip install flask-mysql

COPY . /opt/source-code

ENTRYPOINT FLASK_APP=/opt/source-code/app.py flask run
```

1. OS - Ubuntu

2. Update apt repo

3. Install dependencies using apt

4. Install Python dependencies using pip

5. Copy source code to /opt folder

6. Run the web server using “flask” command

```
docker build Dockerfile -t mmumshad/my-custom-app
```

```
docker push mmumshad/my-custom-app
```

Dockerfile

Dockerfile

INSTRUCTION

ARGUMENT

Dockerfile

FROM Ubuntu

Start from a base OS or another image

RUN apt-get update

RUN apt-get install python

Install all dependencies

RUN pip install flask

RUN pip install flask-mysql

COPY . /opt/source-code

Copy source code

ENTRYPOINT FLASK_APP=/opt/source-code/app.py flask run

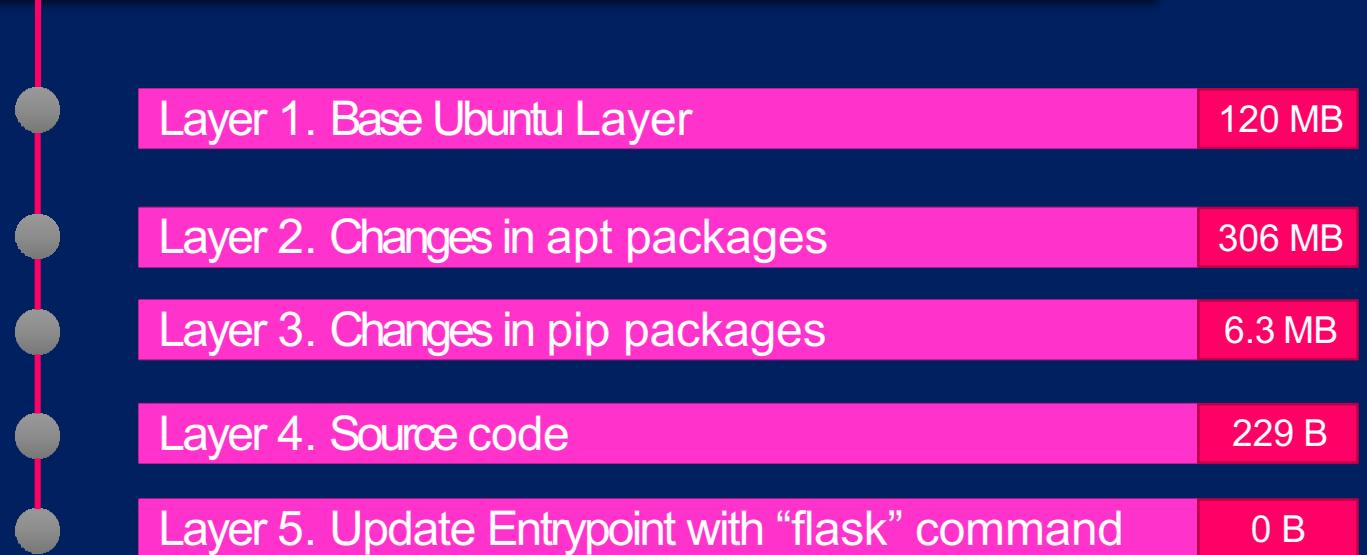

Specify Entrypoint

Layered architecture

Dockerfile

```
FROM Ubuntu  
  
RUN apt-get update && apt-get -y install  
python  
  
RUN pip install flask flask-  
mysql  
  
COPY . /opt/source-  
code  
  
ENTRYPOINT FLASK_APP=/opt/source-code/app.py flask run
```

docker build Dockerfile -t mmumshad/my-custom-app

```
root@osboxes:/root/simple-webapp-docker # docker history mmumshad/simple-webapp  
IMAGE          CREATED      CREATED BY                                         SIZE        COMMENT

```

Docker registry

Image

```
▶ docker run nginx
```

Image

docker.io
Docker Hub

image: docker.io/nginx/nginx

Registry User/ Image/
 Account Repository

gcr.io/ kubernetes-e2e-test-images/dnsutils

Private Registry

```
▶ docker login hub.docker.com
```

Login with your Docker ID to push and pull images from Docker Hub. If you don't have a Docker ID, head over to <https://hub.docker.com> to create one.

Username: registry-user

Password:

WARNING! Your password will be stored unencrypted in /home/vagrant/.docker/config.json.

Login Succeeded

```
▶ docker run private-registry.io/apps/internal-app
```

Deploy Private Registry

```
docker build -t <your-dockerhub-username>/<image_repository_name>:tag .
```

```
docker push <your-dockerhub-username>/<image_repository_name>:tag
```

```
docker pull <your-dockerhub-username>/<image_repository_name>:tag
```

How to rename image with Docker tag

- . Build a Docker image with a tag:

```
perl
```

 Copy code

```
docker build -t my-lab:1.0 .
```

This builds a Docker image with the name `my-lab` and the tag `1.0`.

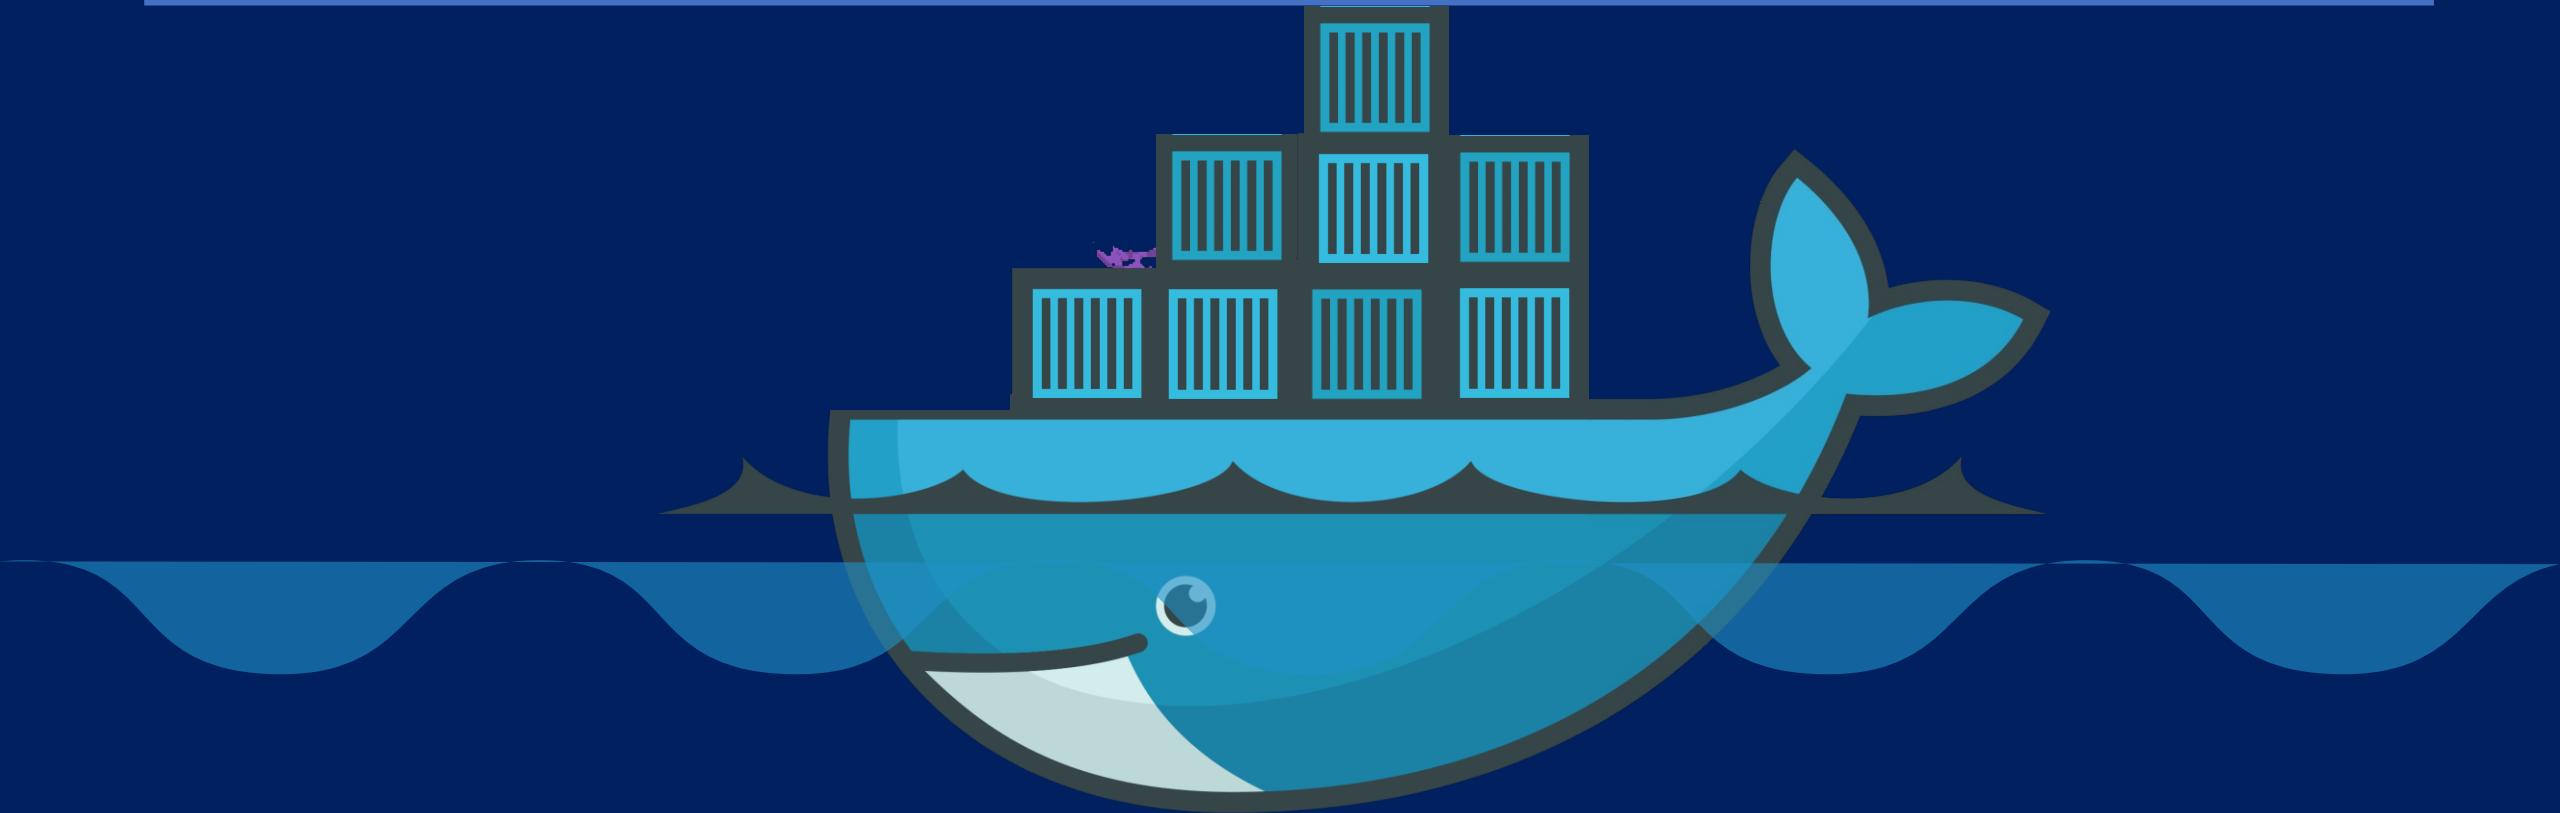

- . Rename the Docker image with a new tag:

```
perl
```

 Copy code

```
docker tag my-lab:1.0 my-registry/my-lab:latest
```

Docker Network

Default networks

```
docker run ubuntu
```

```
docker run Ubuntu --network=none
```

```
docker run Ubuntu --network=host
```

User-defined networks

```
docker network create \
--driver bridge \
--subnet 182.18.0.0/16
custom-isolated-network
```

```
docker network ls
```

NETWORK ID	NAME	DRIVER	SCOPE
dba0fb9370fe	bridge	bridge	local
46d476b87cd9	customer-isolated-network	bridge	local
6de685cec1ce	docker_gwbridge	bridge	local
e29d188b4e47	host	host	local
mmrho7vsb9rm	ingress	overlay	swarm
d9f11695f0d6	none	null	local
d371b4009142	simplewebappdocker_default	bridge	local

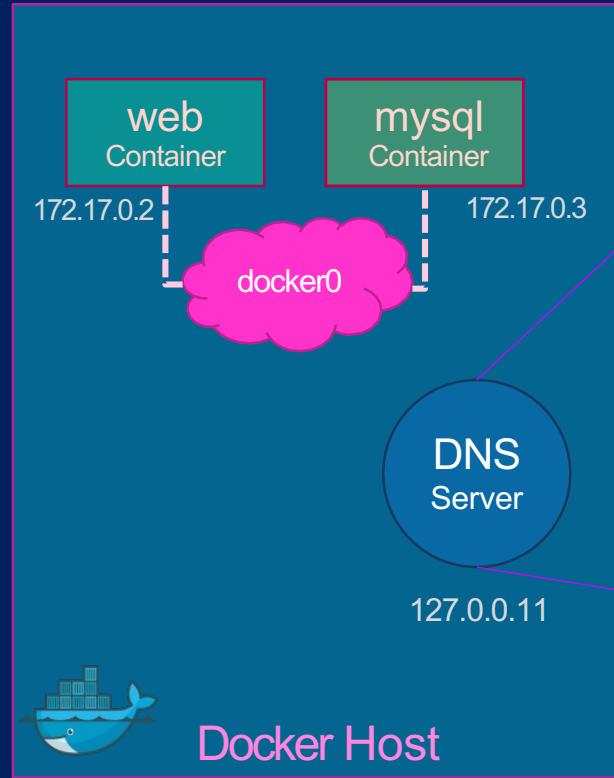

Inspect Network

```
▶ docker inspect blissful_hopper
```

```
[  
 {  
   "Id": "35505f7810d17291261a43391d4b6c0846594d415ce4f4d0a6ffbf9cc5109048",  
   "Name": "/blissful_hopper",  
   "NetworkSettings": {  
     "Bridge": "",  
     "Gateway": "172.17.0.1",  
     "IPAddress": "172.17.0.6",  
     "MacAddress": "02:42:ac:11:00:06",  
     "Networks": {  
       "bridge": {  
         "Gateway": "172.17.0.1",  
         "IPAddress": "172.17.0.6",  
         "MacAddress": "02:42:ac:11:00:06",  
       }  
     }  
   }  
 }]
```

Embedded DNS

```
mysql.connect( mysql )
```

Host	IP
web	172.17.0.2
mysql	172.17.0.3

Lab Docker Network with Subnet

This guide explains how to create a lab Docker network with a specific subnet using a busybox container.

- 1. Create a new Docker network named "lab_network" with a specific subnet, e.g., 192.168.100.0/24, using the following command:**

```
docker network create --subnet 192.168.100.0/24 lab_network
```

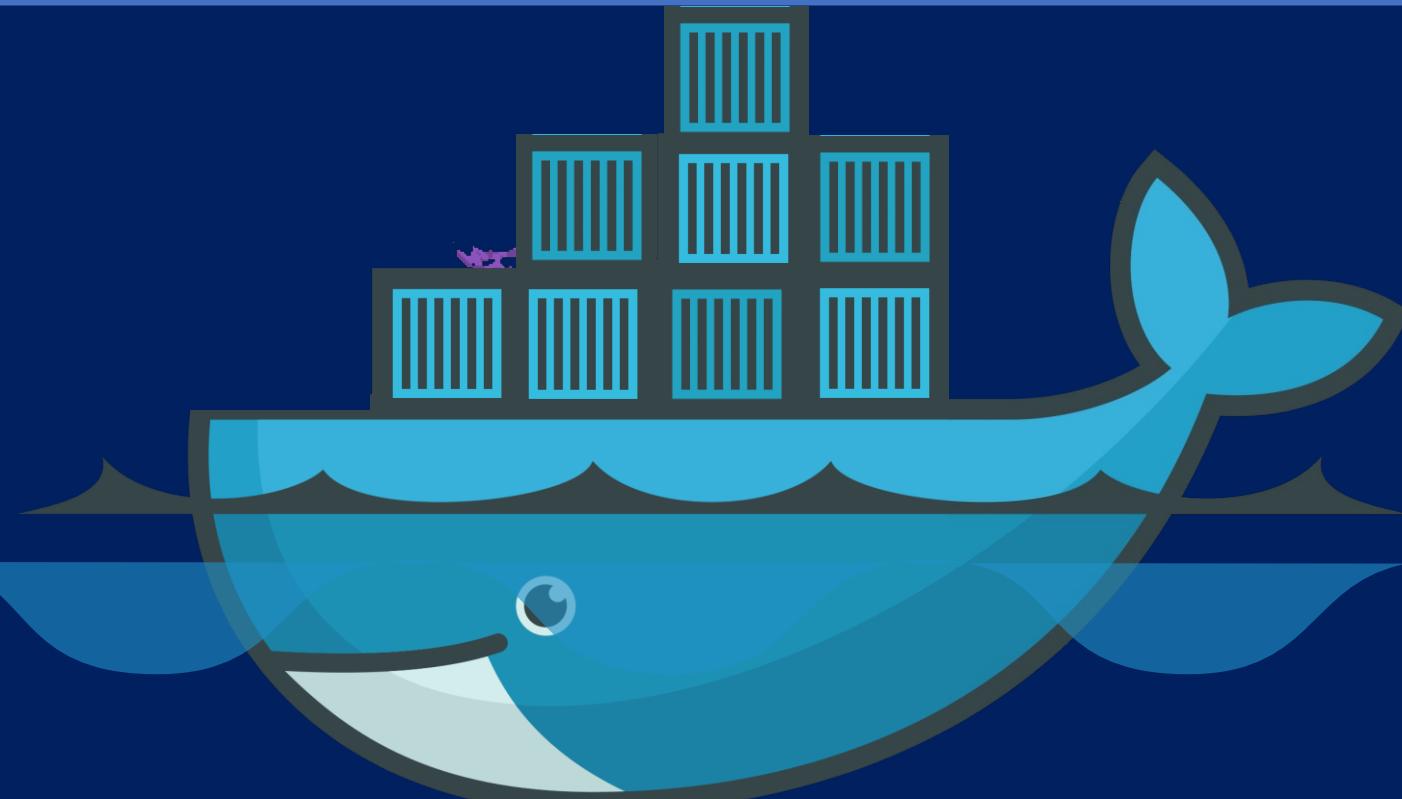

- 2. To confirm that the "lab_network" has been created and to view its settings, run the following command:**

```
docker network inspect lab_network
```

- 3. Run a new container with the busybox image and connect it to the "lab_network" using the following command:**

```
docker run --name busybox_container --network lab_network busybox
```

Docker compose

Docker compose

```
docker run yourname/simple-webapp
```

```
docker run mongodb
```

```
docker run redis:alpine
```

```
docker run ansible
```

```
docker-compose.yml
```

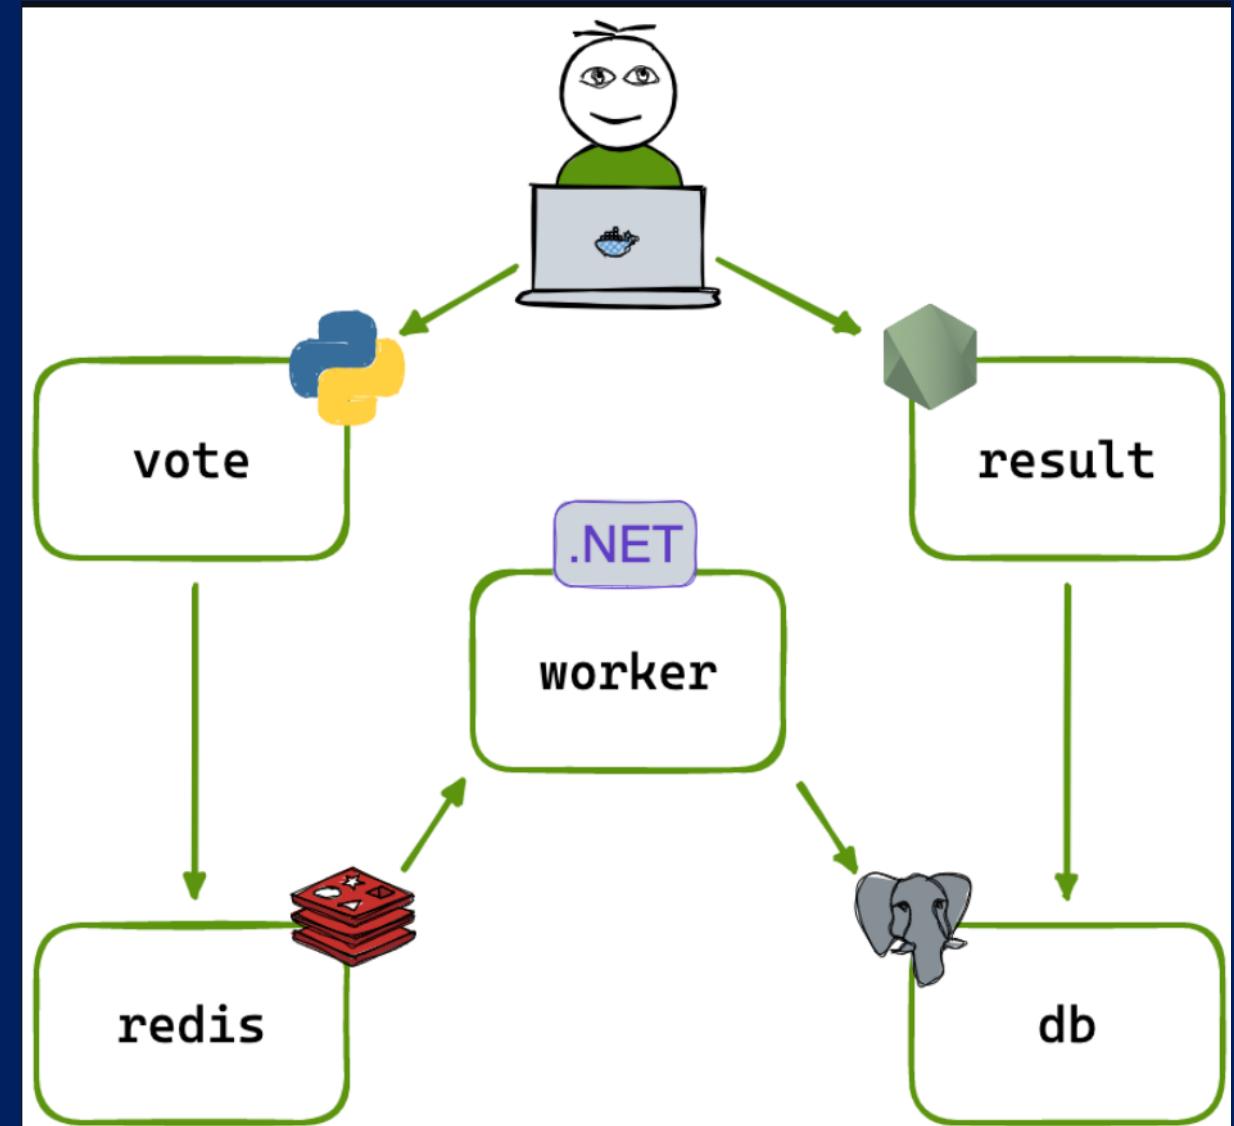

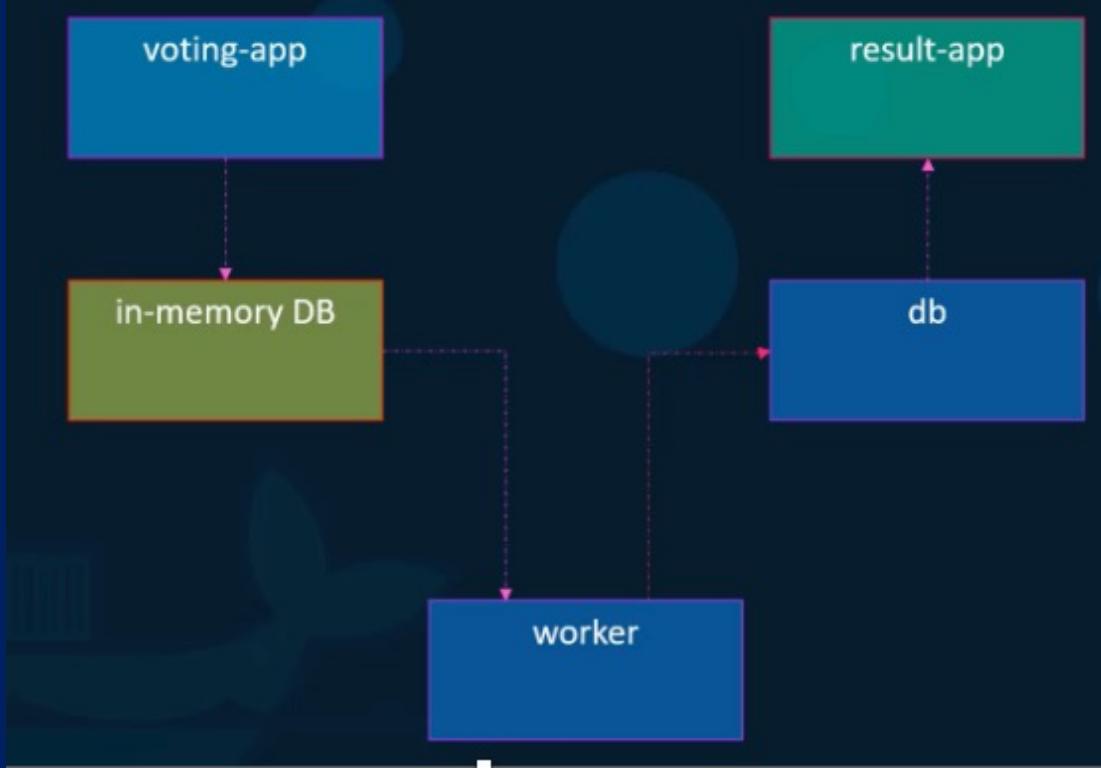

```
services:  
  web:  
    image: "yourname/simple-webapp"  
  database:  
    image: "mongodb"  
  messaging:  
    image: "redis:alpine"  
  orchestration:  
    image: "ansible"
```

```
docker-compose up
```

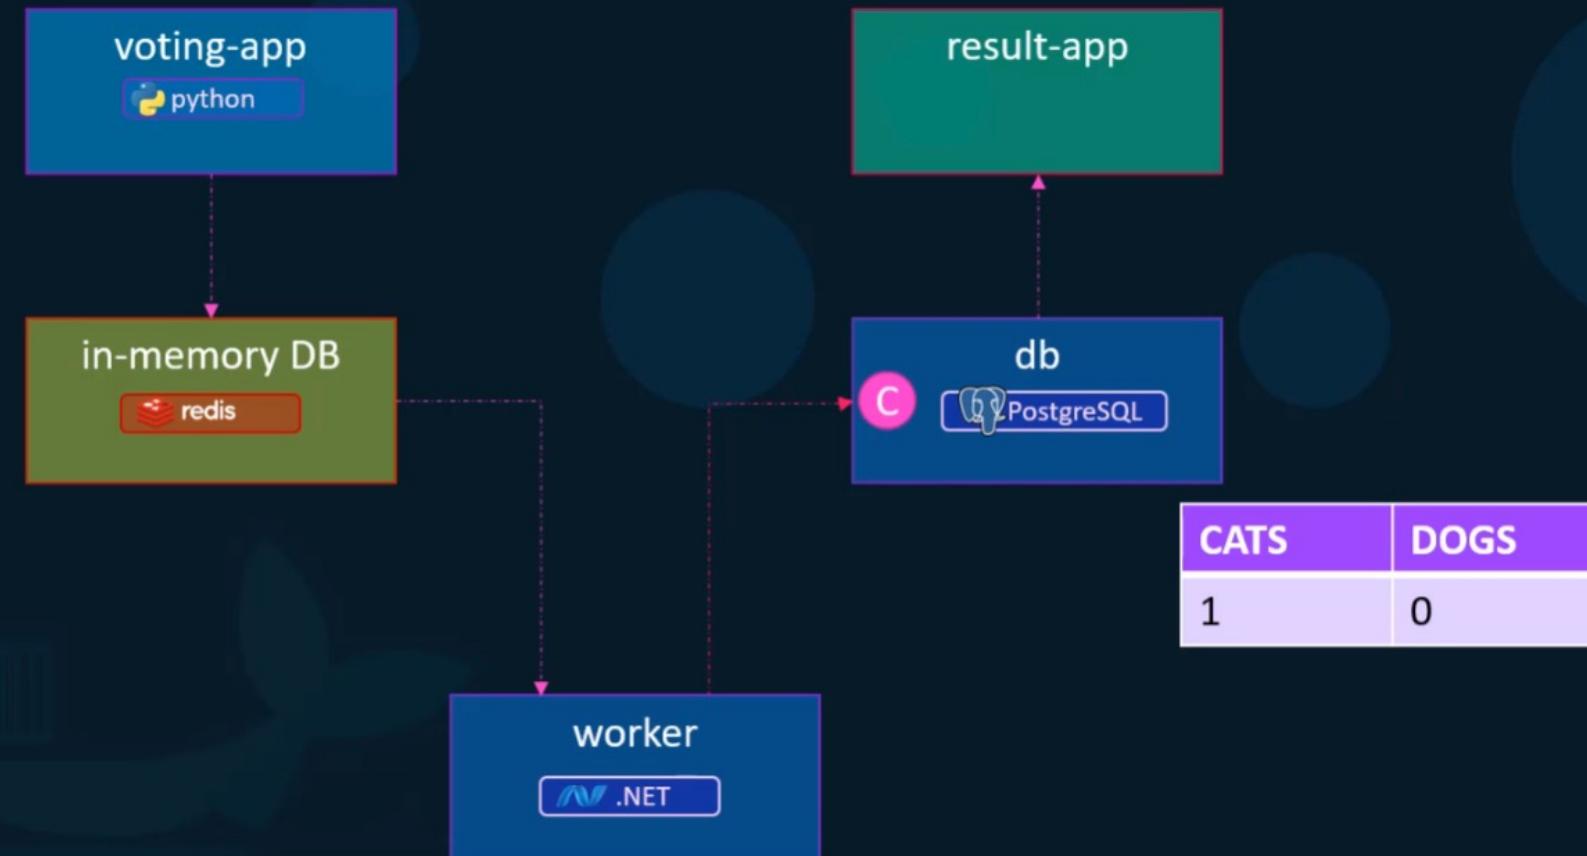

Public Docker registry - dockerhub

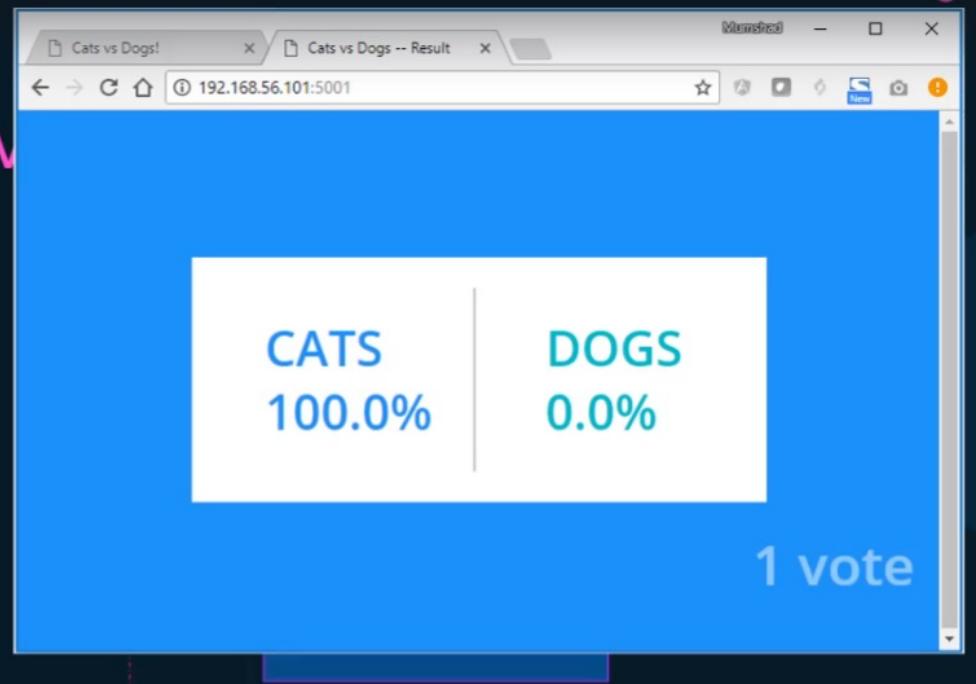

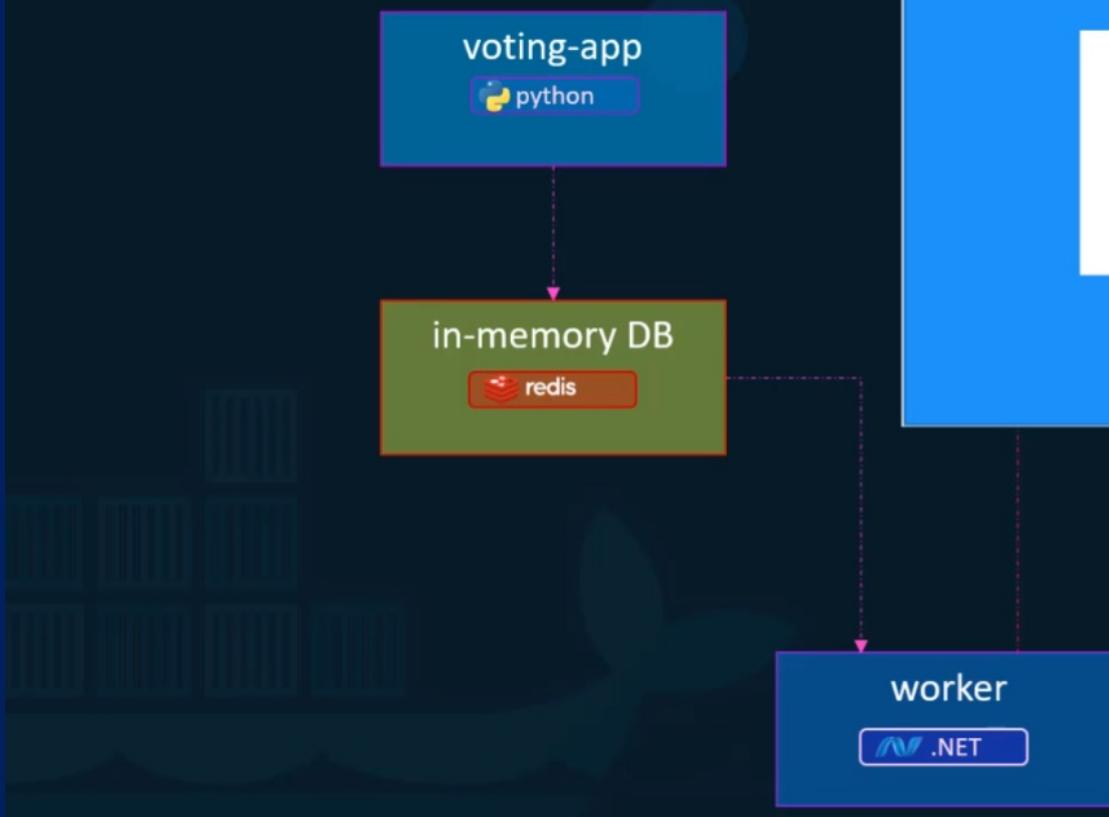

- A front-end web app in [Python](#) which lets you vote between two options
- A [Redis](#) which collects new votes
- A [.NET](#) worker which consumes votes and stores them in...
- A [Postgres](#) database backed by a Docker volume
- A [Node.js](#) web app which shows the results of the voting in real time

```

You can run a Python script from within a shell script using the `python` command and capture its output using command substitution.

Here's an example:

bash

 Copy code

```
#!/bin/bash

# Run Python script and capture its output
output=$(python my_python_script.py)

# Print the output
echo $output
```

In this example, the shell script runs a Python script called `my_python_script.py` and captures its output into a variable called `output`. The `echo` command then prints the contents of the `output` variable.

You can modify this script to suit your specific needs by replacing `my_python_script.py` with the path to your Python script and modifying the `echo` command to do something else with the output.
