- Git was developed in 2005 by **Linus Torvalds**
- Git is **Version control system** is a system that records changes to a file or set file over time so that you. can restore specific version later
- Git is a **Distributed Version Control System**

Repository

A Git "Repo" is a workspace which tracks and manages files within a folder.

Anytime we want to use Git with a project, app, etc we need to create a new git repository. We can have as many repos on our machine as needed, all with separate histories and contents

Portfolio Website

Startup Idea

My First Movie Script

Symphony #17

Reddit Clone App

Git helps us...

Track changes across multiple files

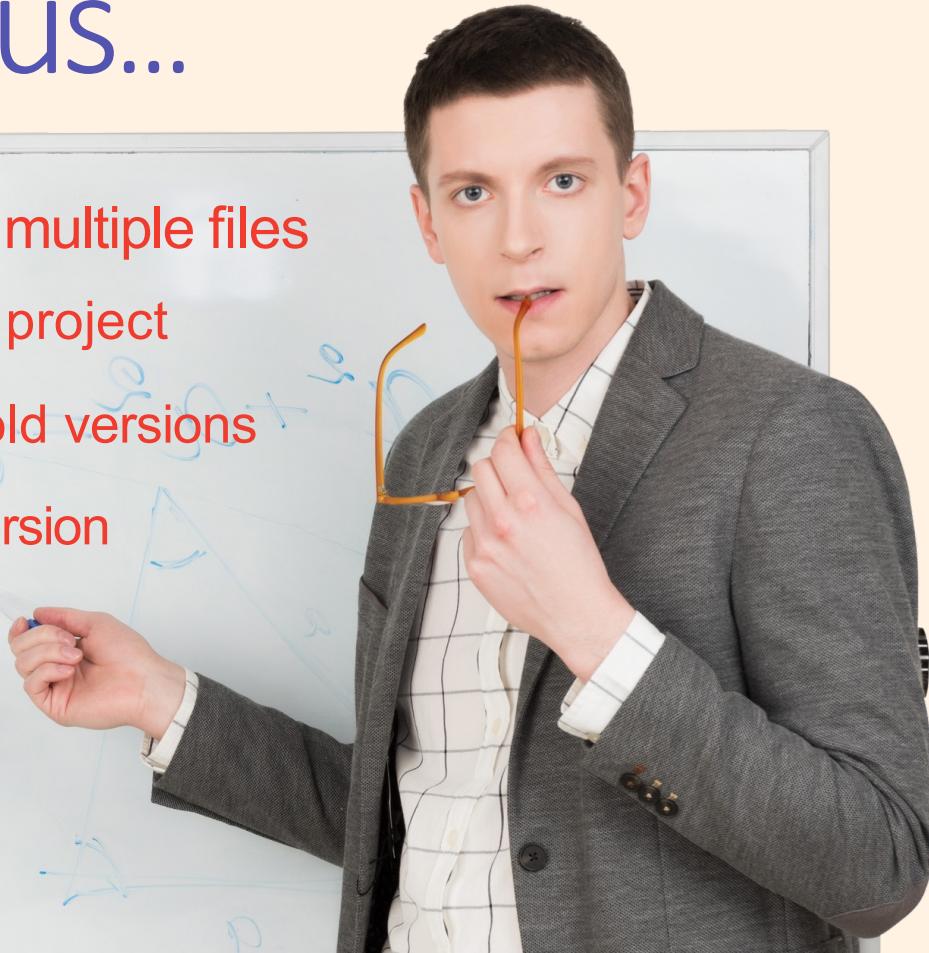

Compare versions of a project

"Time travel" back to old versions

Revert to a previous version

Collaborate and
share changes

Combine changes

Git – What and Why

Oh boy, I sure do
love playing my
video games!

I'm going to save
my game now in
case I die soon!

Oh jeez, this is
going to be a
difficult fight!

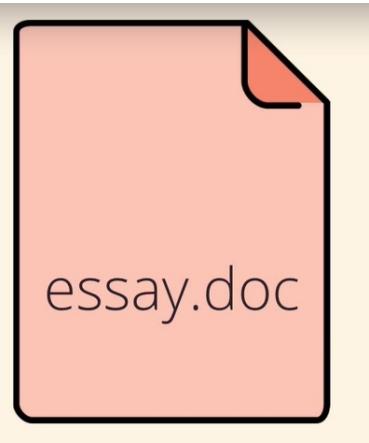

ughhhh I died!

Thank heavens I
saved my game! I
can just revert!

Add First Row

Finish Bottom Row

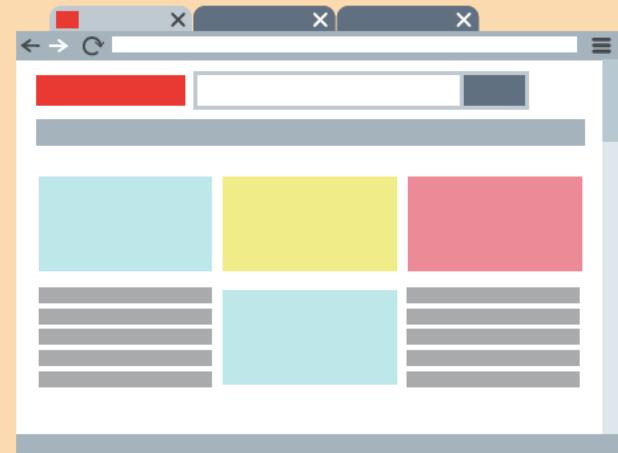

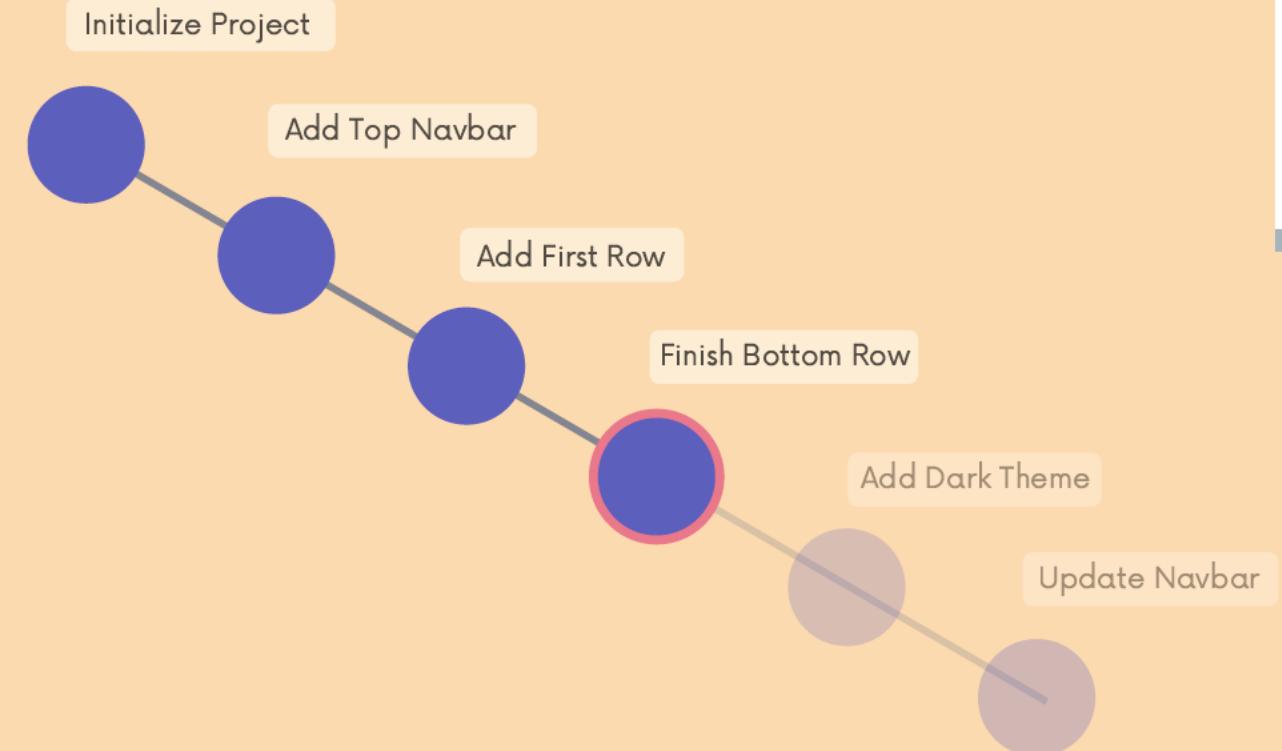

Add A Checkpoint

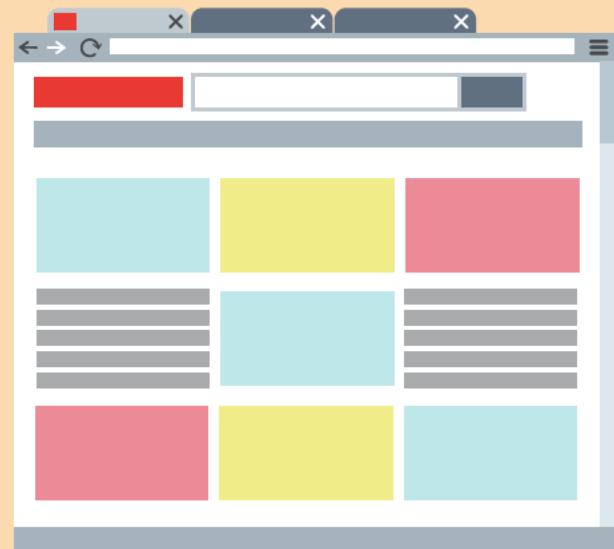

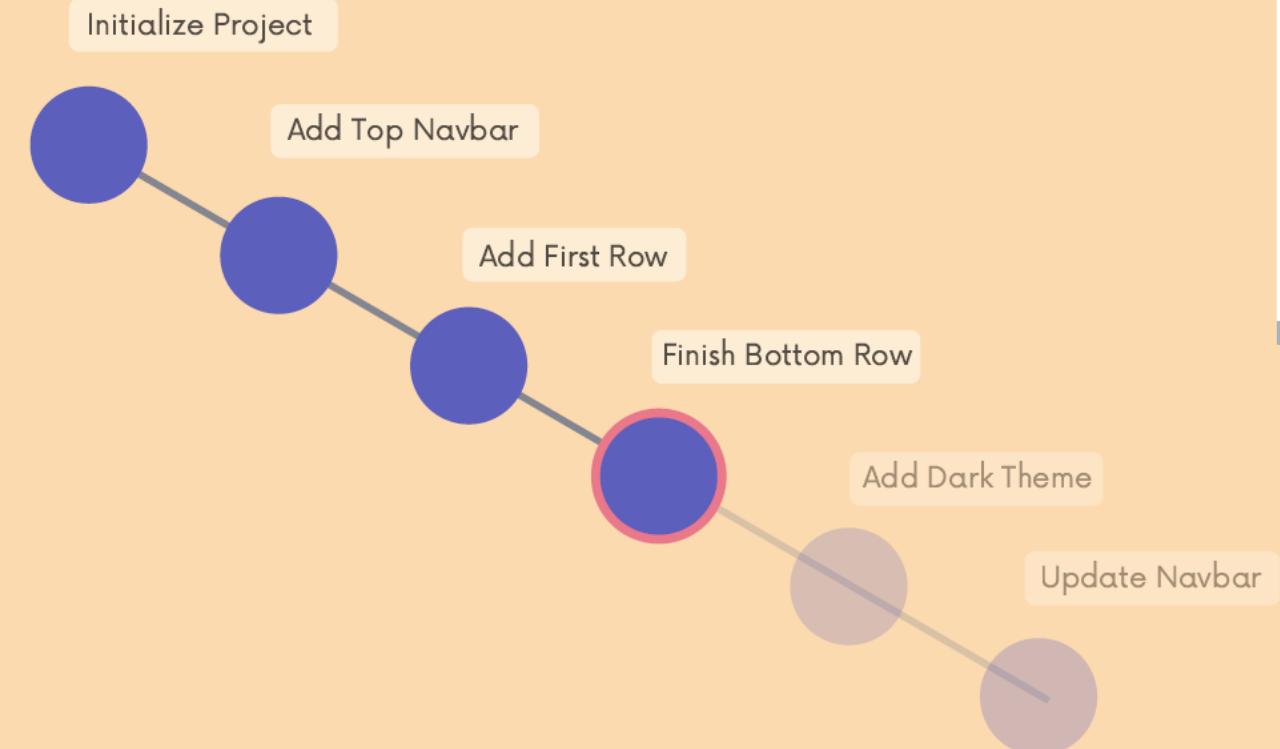

A woman with long brown hair, wearing a brown blazer over a light-colored shirt and shorts, is shouting and pointing her right index finger towards the right side of the frame. She is holding a small blue object in her left hand.

**ANGRY BOSS SAYS...
THE COLORS ARE BAD!**

I can go back to prior checkpoints I made!

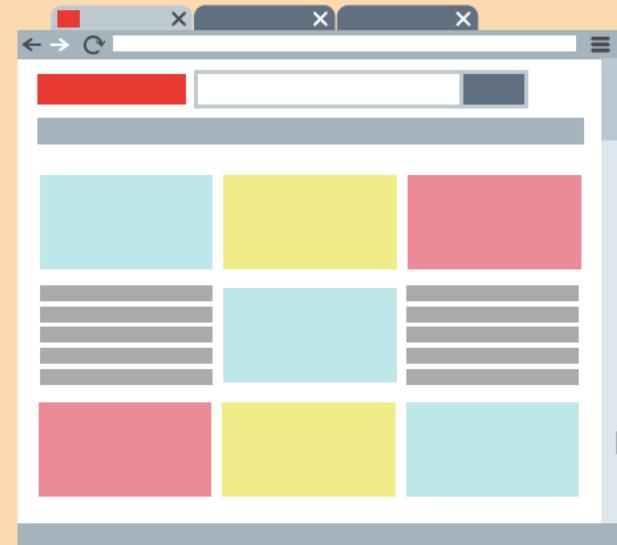

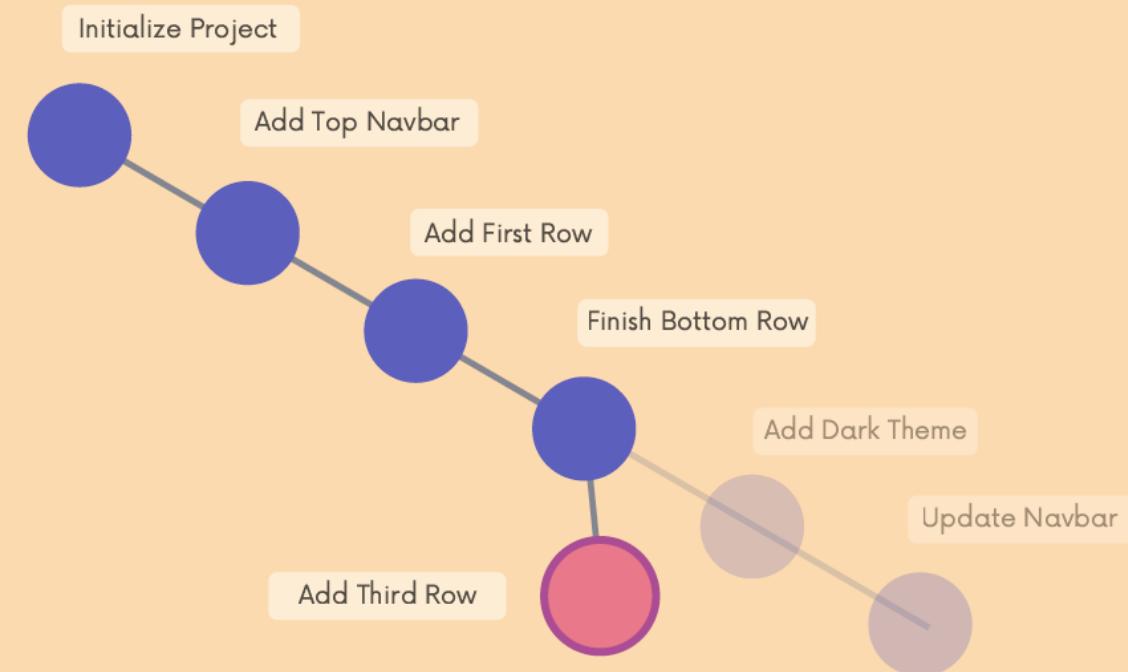

I can even start more work off of an old checkpoint

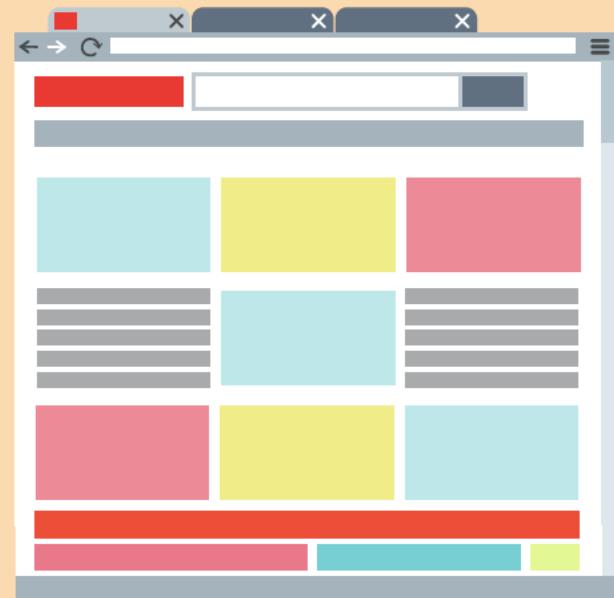

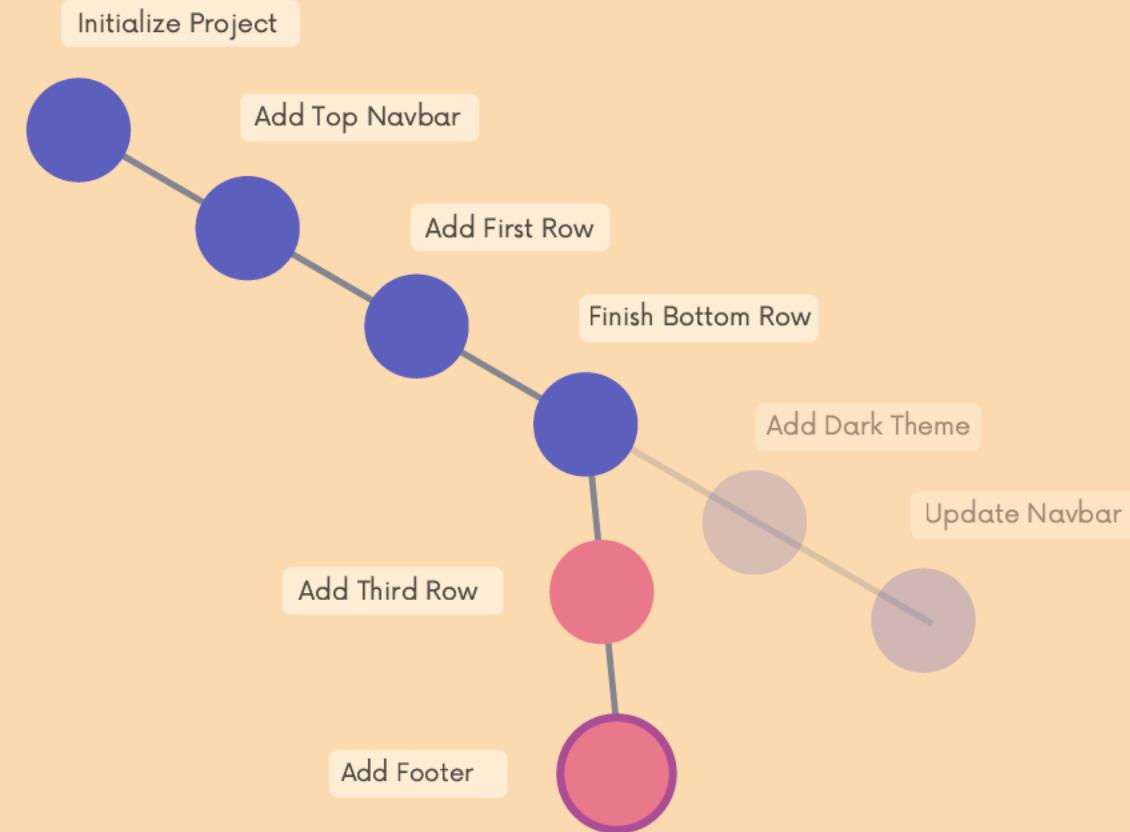

I add more content!

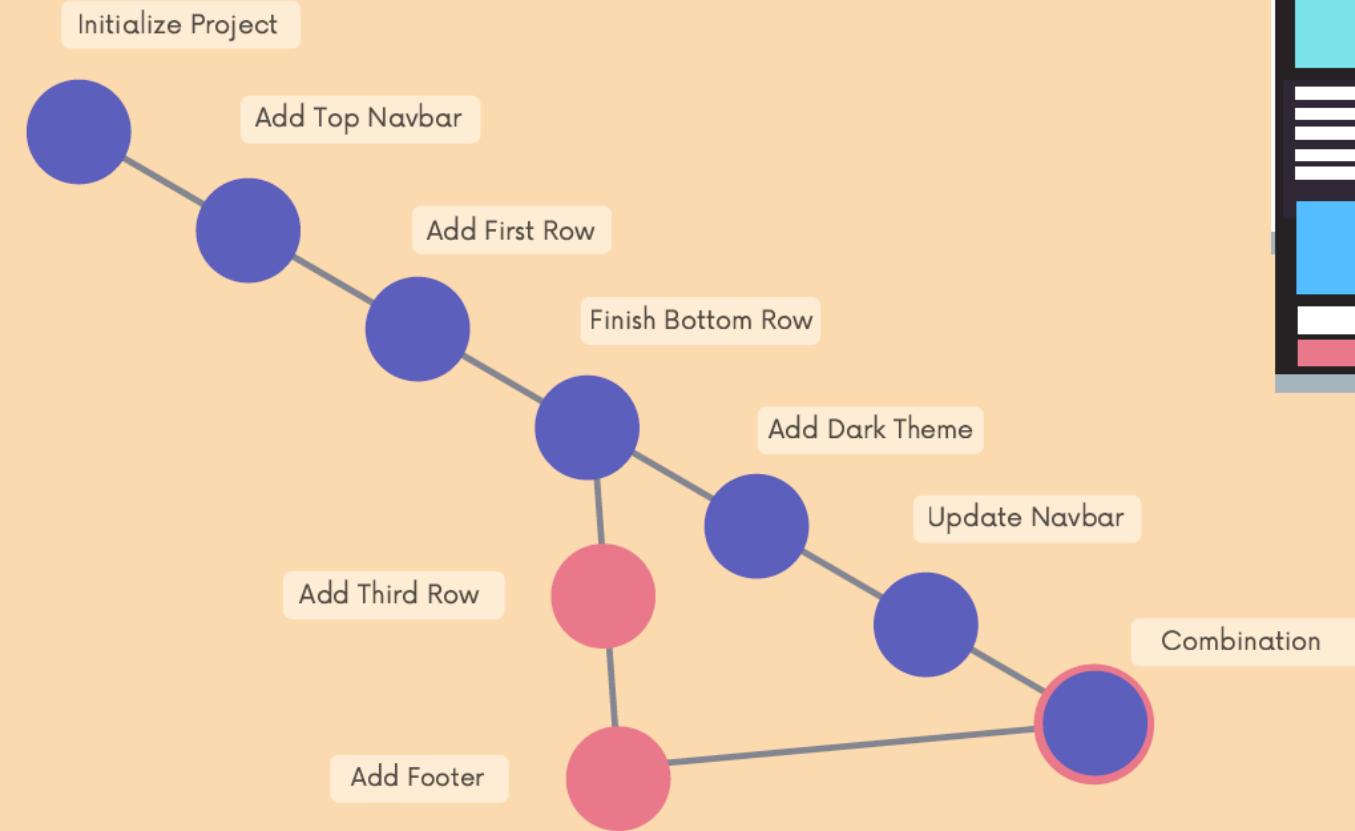

I add a new checkpoint!

Another checkpoint!

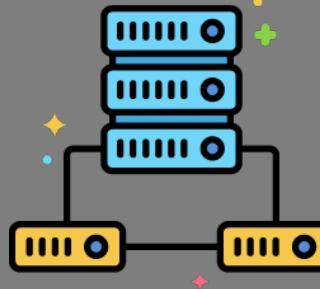

And I can even combine checkpoints!

Version Control System

Version Control System - Git

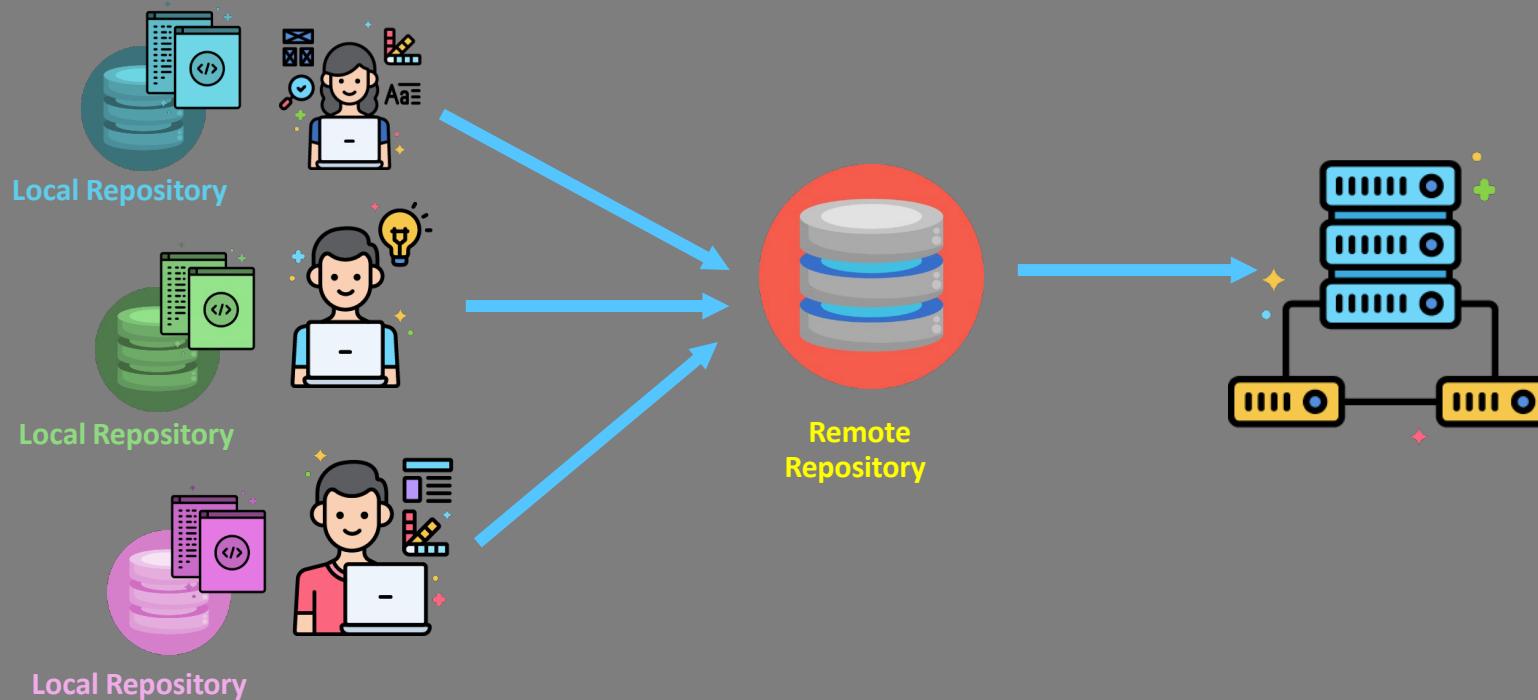

Why Git?

- Distributed

Centralized Version Control System

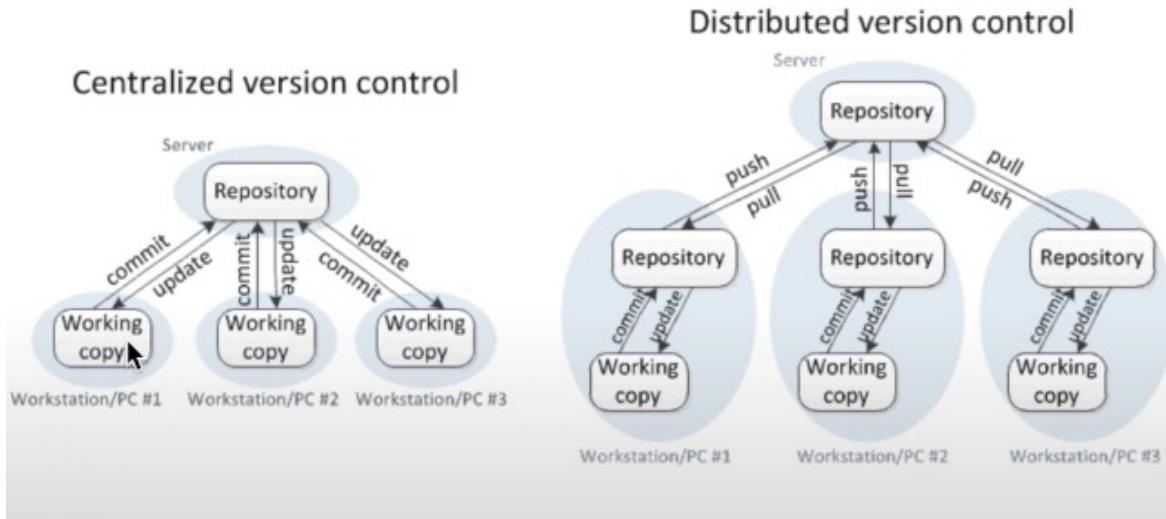

Distributed Version Control System

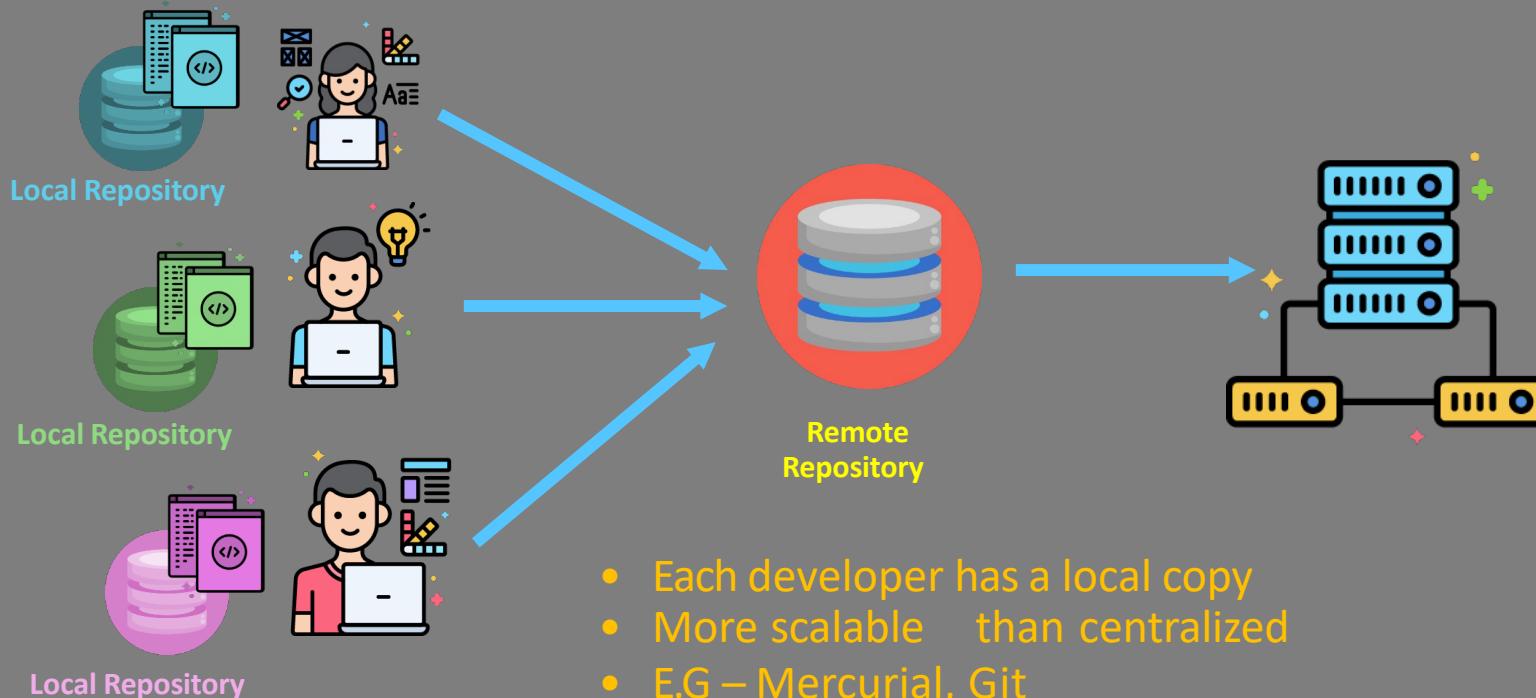

Centralized vs Distributed

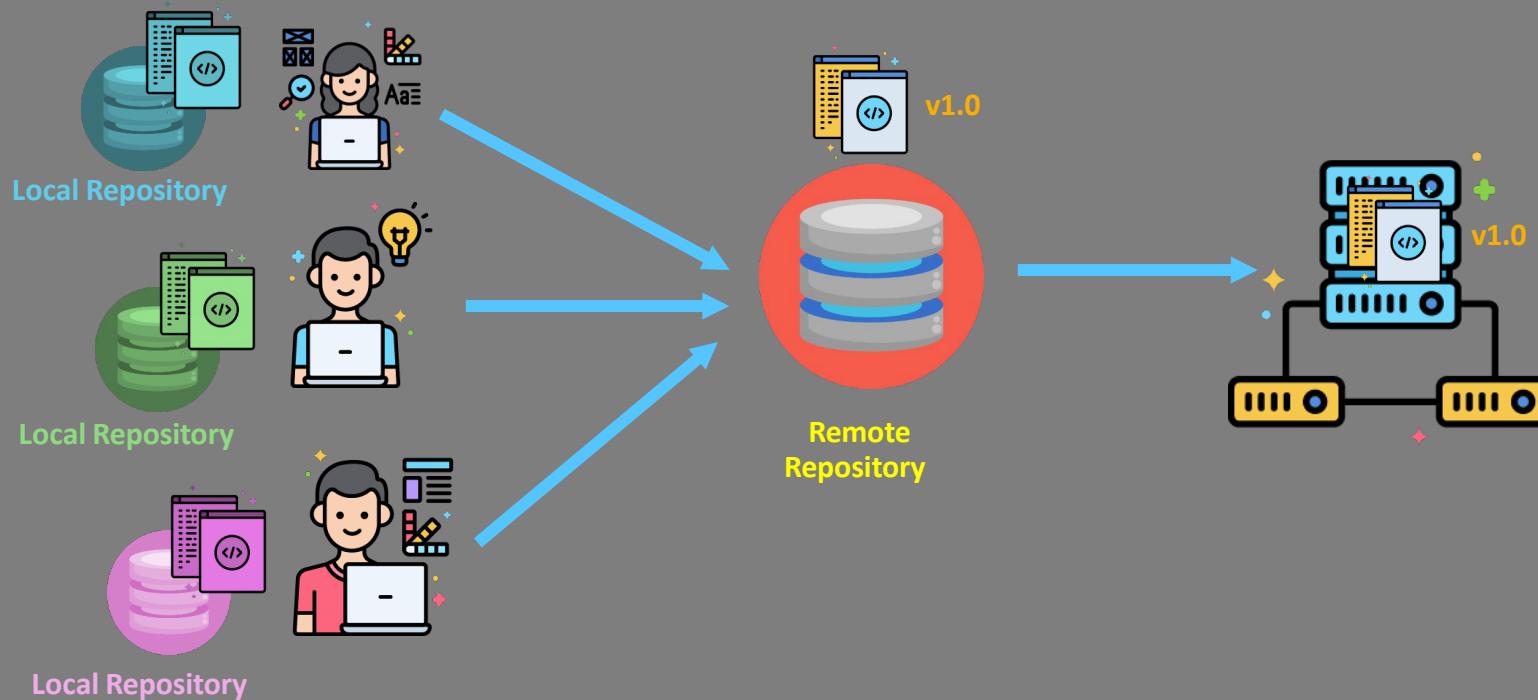

Version Control

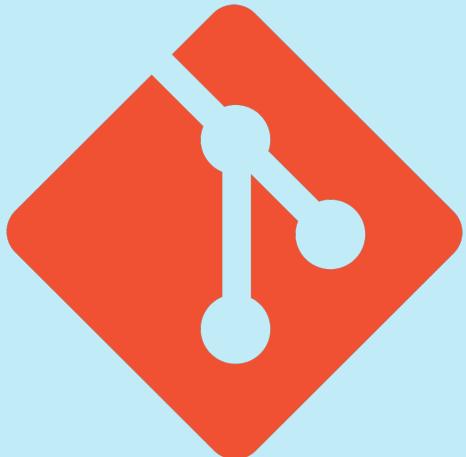

Distributed Version Control System

Distributed Version Control System

Version Control System

Why Git?

- Distributed
- Performant
- Detailed audit tracking
- Open source
 - Free!
 - Implemented with Kubernetes GitOps, integration with Jenkins and other DevOps tools
 - GitHub, GitLab, Code Commit are all based on Git

Git vs GitHub

Git Vs. GitHub

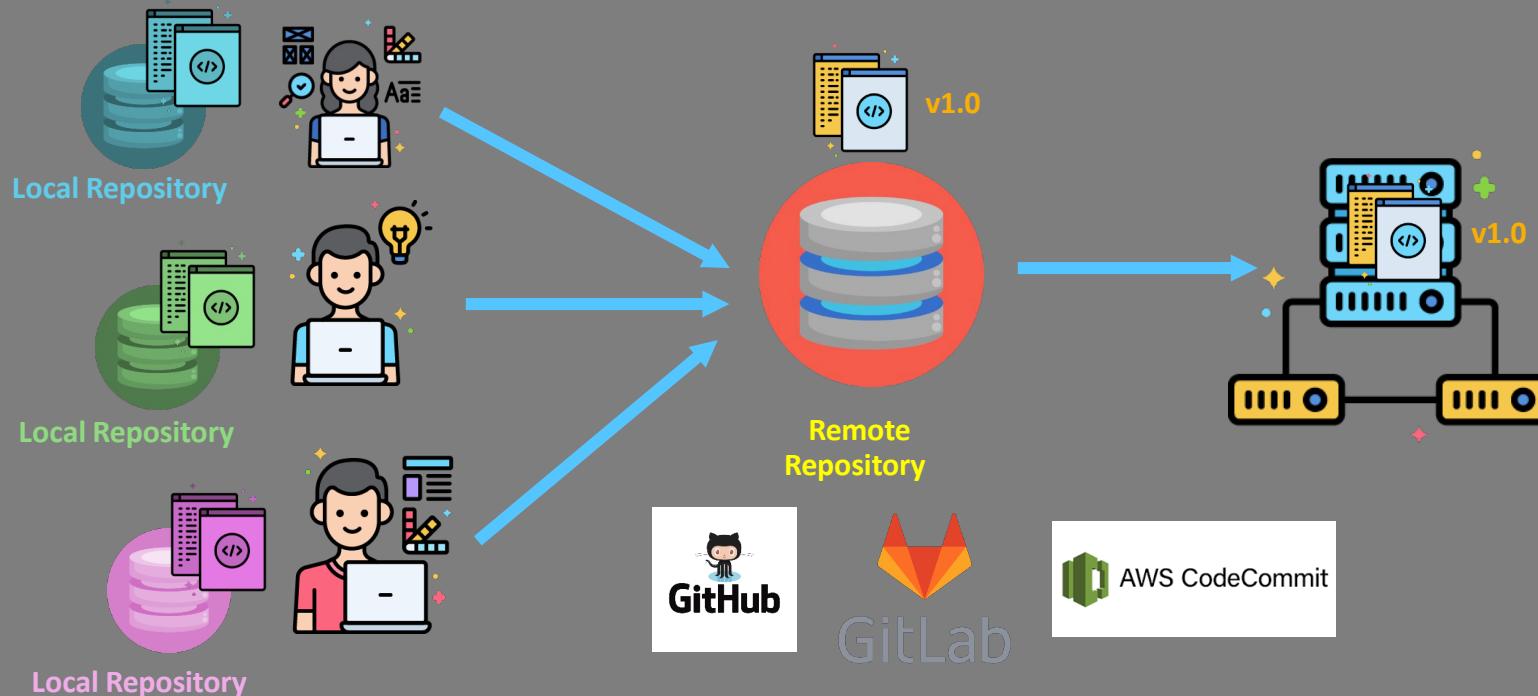

- Version Control System
- Installed locally on the system
- Created in 2005, by Linus Torvalds
- Open source, and used in multiple cloud repository services

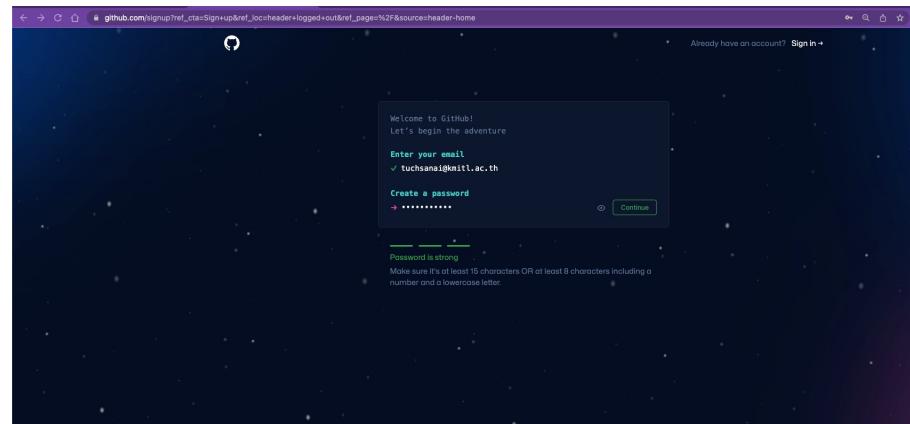

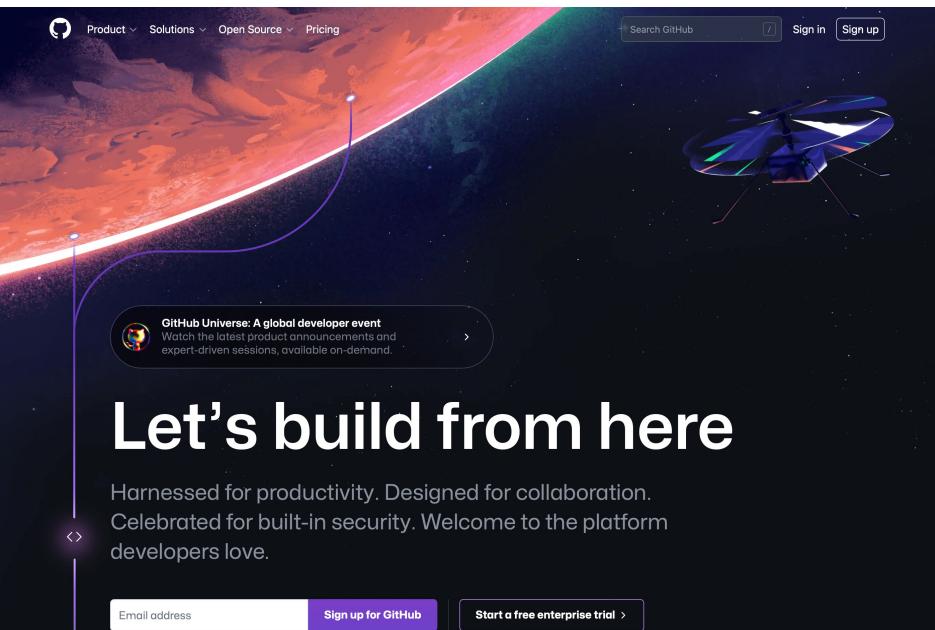

- Git repository hosting services with other features
- Runs on the cloud
- Created in 2008, currently owned by Microsoft
- Not open source, have free and paid tiers

Distributed Version Control System

Week 1 - Starting with Git

Sign Up : <https://github.com>

<https://github.com>

Installing Git

Week 1 - Starting with Git

- Let's install git on to your computer!
 - The installation process will be slightly different depending on your Operating System.

Week 1 - Starting with Git

- MacOS or Linux Users:**

- Congrats! You already have Git installed on your machine since it comes pre-installed as part of your OS.
 - To confirm this, open up a terminal and type:
 - `git --version`
 - `>> git version 2.25.1 (Apple Git-128)`

Week 1 - Starting with Git

- **MacOS or Linux Users:**
 - If you wish to update or re-install git, you can do this by simply selecting the MacOS or Linux links on the official git website:
 - **<https://git-scm.com/downloads>**

Week 1 - Starting with Git

- **MacOS or Linux Users:**

- Now we'll be editing text files for this course, which means we need a text editor.
- If you're in this course, we'll assume you've used a text editor before, and often people have very strong opinions on a preferred text editor!

Week 1 - Starting with Git

- **MacOS or Linux Users:**

- Our suggested text editor for this course is VS Code:
 - <https://code.visualstudio.com/>
- It's created by Microsoft and has direct integrations with GitHub and is one of the most popular text editors today.
- You can follow along with any text editor you prefer however.

Week 1 - Starting with Git

- **Windows Users:**

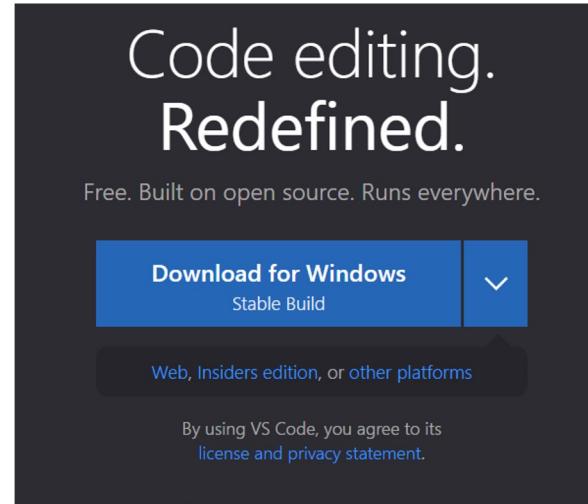

- Our *HIGHLY* recommend text editor for this course is VS Code:
 - **<https://code.visualstudio.com/>**
- Why *HIGHLY* recommended?
 - Windows + VS Code + GitHub
 - Upon installing git you will be asked to select a default editor, you'll need VS Code installed to select it as default.

Week 1 - Starting with Git

- **Windows Users:**

- Go to:
 - <https://code.visualstudio.com/>
- Download with Default Settings:

Week 1 - Starting with Git

- **Windows Users:**

- Next we'll download git, go to:
 - **<https://git-scm.com/>**

The screenshot shows the 'Downloads' section of the git-scm.com website. At the top, there's a navigation bar with links for 'About', 'Documentation', 'Downloads', 'GUI Clients', and 'Logos'. Below this, there's a sidebar with links for 'Community' and 'Pro Git book'. The main content area features a large image of a Mac desktop with a Git interface. To the right, there's a summary of the latest source release (2.38.1) with a 'Download for Mac' button. Below this, sections for 'GUI Clients' (with a link to 'View GUI Clients') and 'Logos' (with a link to 'View Logos') are shown. At the bottom, there's a section for 'Git via Git' with a note about getting the latest development version via Git itself.

Git via Git

If you already have Git installed, you can get the latest development version via Git itself:

`git clone https://github.com/git/git`

You can also always browse the current contents of the git repository using the web interface.

DAY 1

Configure Git

Week 1 - Starting with Git

- So far we've:
 - Installed Git
 - Created a GitHub Account Profile
 - Installed GitHub Desktop and VS Code
- What left for Day 1:
 - Configure Git Locally
 - Create a Repository
 - Explore VS Code Integrations
 - Exercise and Solution

Week 1 - Starting with Git

- Take careful note of the user name and email address you register with at GitHub, ideally it will be the same username and email you configure git with locally.
- We can technically use any username/email we want, but your history of “commits” (changes to code) will be saved in the public log of changes in the repository.

Week 1 - Starting with Git

- In this lecture we will set-up a name and email address on our local installation of Git.
- If you only ever used Git locally by yourself then this username and email would just be stored on your local historical logs.
- However if you end up working with others and using GitHub, this information will be useful to identify who did what.

Week 1 - Starting with Git

- You can check the current configuration with the commands:
 - **git config user.name**
 - **git config user.email**
- The configuration commands will be:
 - **git config --global user.name “user”**
 - **git config --global user.email “email”**
- If switch with another github account
 - **git config --global user.name “user”**
 - **git config --global user.email “email”**
 - **git config --global credential.username “user”**

Show global Git configuration?

```
git config --list or git config -l
```

or look at your `~/.gitconfig` file. The local configuration will be in your repository's `.git/config` file.

```
git config --list --show-origin
```

Week 1 - Starting with Git

- Let's head over to our command line interface to set-up our Git configuration:
 - Git Bash
 - Terminal
 - Command Prompt

Week 1 - Starting with Git

DAY 1

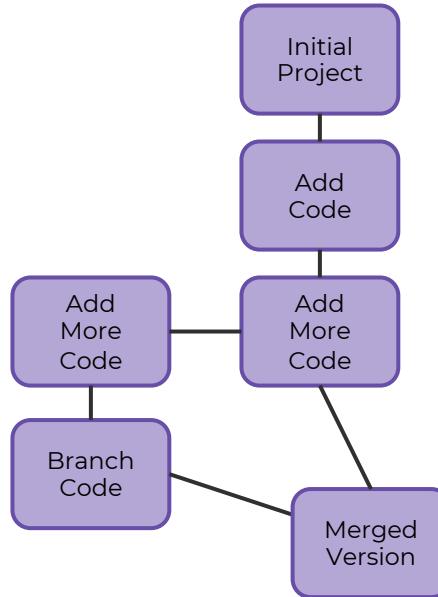

Creating a Git Repository

Day 1 - Starting with Git

- The main place we track changes and manage our files that are using Git is called a **repository**.

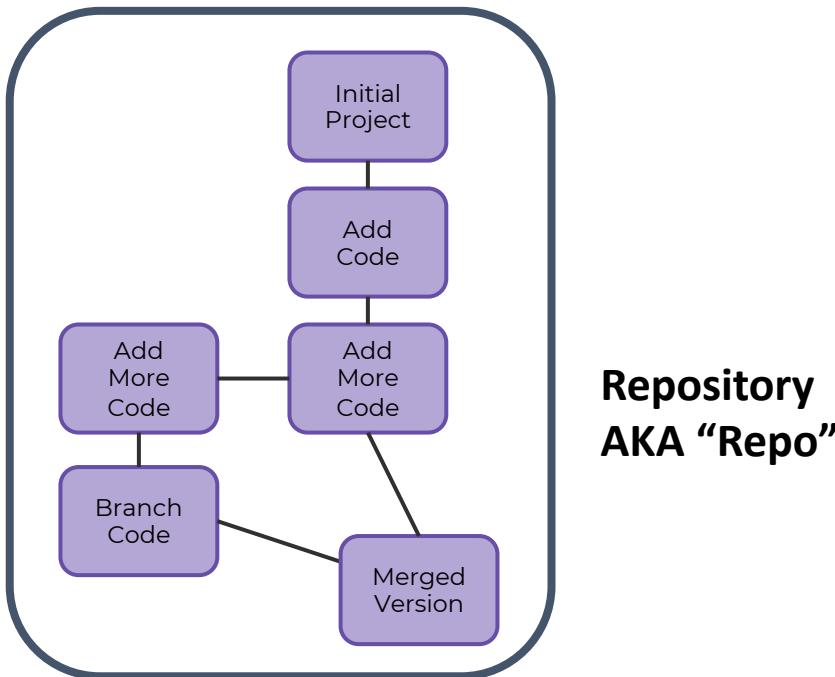

Day 1 - Starting with Git

- The main place we track changes and manage our files that are using Git is called a **repository**.

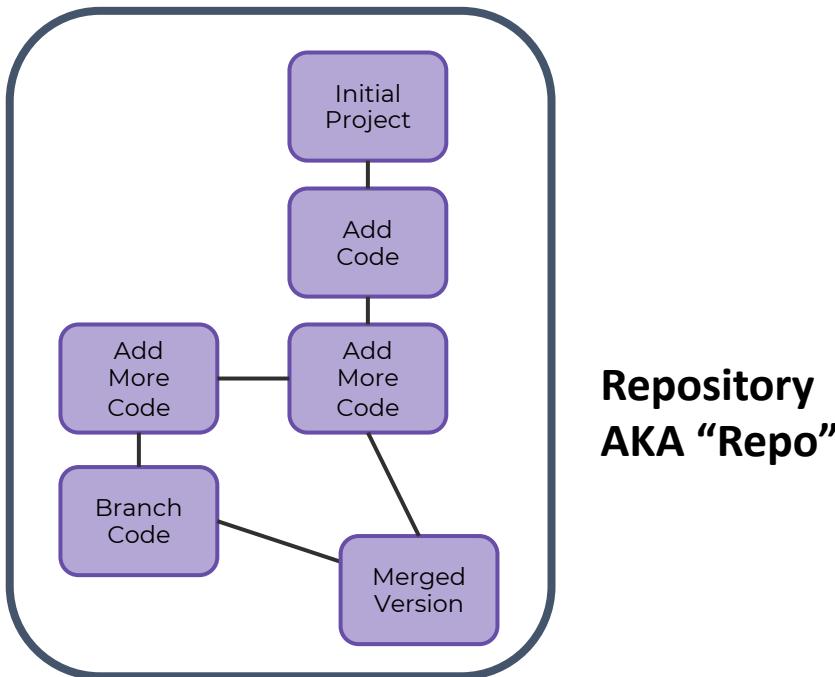

Day 1 - Starting with Git

- The main place we track changes and manage our files that are using Git is called a **repository**.

Day 1 - Starting with Git

- Let's explore a public repository:
 - <https://github.com/tensorflow/tensorflow>

Repository
AKA “Repo”

Day 1 - Starting with Git

- How can we create a Git Repository?
 - **git init**
 - This command initializes a Git Repository on your local machine.
 - You only need to run this command once per project.
 - **git status**
 - This command will report back the status of your Git repository.

Day 1 - Starting with Git

- How can we create a Git Repository?
 - Upon creating a repository with **git init** you will create a hidden .git file.
 - The .git file is a hidden file that manages the versioning of the files inside the Git repository.

Day 1 - Starting with Git

- Git inside a Folder/Directory:
 - Upon creating a Git Repository, all the folders/directories inside the top level Git Repository will also be part of that Repository, meaning all the changes are tracked.

Day 1 - Starting with Git

- Git inside a Folder/Directory:
 - Upon creating a Git Repository, all the folders/directories inside the top level Git Repository will also be part of that Repository, meaning all the changes are tracked.

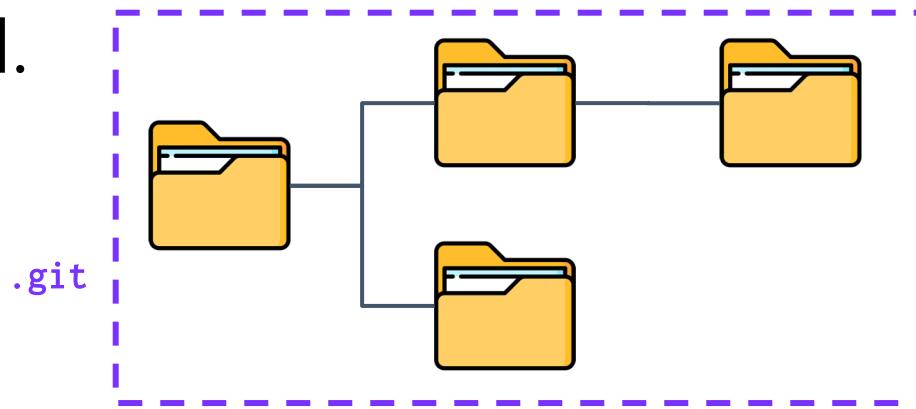

Day 1 - Starting with Git

- Git inside a Folder/Directory:

Day 1 - Starting with Git

- Git inside a Folder/Directory:
 - Upon creating a Git Repository, all the folders/directories inside the top level Git Repository will also be part of that Repository, meaning all the changes are tracked.

Ignoring Files

We can tell Git which files and directories to ignore in a given repository, using a `.gitignore` file. This is useful for files you know you NEVER want to commit, including:

- Secrets, API keys, credentials, etc. Operating
- System files (`.DS_Store` on Mac) Log files
- Dependencies & packages

.gitignore

Create a file called .gitignore in the root of a repository. Inside the file, we can write patterns to tell Git which files & folders to ignore:

- `.DS_Store` will ignore files named `.DS_Store`
- `folderName/` will ignore an entire directory
- `*.log` will ignore any files with the `.log` extension

<https://www.toptal.com/developers/gitignore>

↗ **gitignore.io**

สร้างไฟล์ .gitignore ที่มีประโยชน์สำหรับโปรเจกต์ของคุณ

ซอฟต์แวร์ | ผลงานเอกสาร คำอธิบาย คอมมานต์ไลน์ คู่มือ!

Day 1 - Starting with Git

- How can we create a Git Repository?
 - We can also use the Graphical Interface with GitHub Desktop or we can even create a new repository online at www.github.com.
 - Then we can **git clone** this repository to our local machine.

Day 1 - Starting with Git

- Let's create our first local Git repository at the command line.
- Then we'll create a repository on GitHub and use **git clone** to clone it to our local computer.
 - We'll need to set-up some tokens in order to clone private repositories.

DAY 1

Private Repositories and Tokens

Day 1 - Starting with Git

- We discovered we can easily clone other public repositories with the **git clone** command and then the HTTPS URL for the public repository.
- Now let's explore how to deal with private repositories we wish to clone.

Day 1 - Starting with Git

- Option 1: Command Line:
 - Create Personal Access Tokens (PAT) on Github.com
 - When using the **git clone** command, reference the PAT.
- Option 2: GitHub Desktop Tool GUI:
 - Open the Github Desktop Tool
 - Login with GitHub Username and PW
 - Clone Repo via GUI

Day 1 - Starting with Git

- Clone Syntax with PAT:

```
git clone https://token@github.com/account/repo.git
```

- Previously we used:

```
git clone https://github.com/account/repo.git
```

DAY 1

Summary and Exercise

Day 1 - Starting with Git

- **Exercise Tasks:**
 - Create a new Private Repository on GitHub.
 - Initialize your repository with README, license and gitignore.
 - Clone your Repository using the Command Line and a PAT.
